AIR WARMING SYSTEM FOR VENOUS ACCESS

Airglove is a unique warming system developed to enable access to the veins in a patients arm for the delivery of intravenous drugs.

It gently heats the patients arm up as it forces warm air through a double walled polythene glove.

PATIENT FEEDBACK

It was pleasant and worked quicker than the heat pad I had been given previously

Comfortable. I enjoyed having a warm arm

Better than water

It was very good, not too hot and very relaxing

Very easy and straightforward to use

CLINICIAN FEEDBACK

Very easy and straightforward to use

Heats the arm up quicker than the heat pad

I like it because it makes the veins more visible

Heated the whole arm, so lots of places to try

It makes the patient feel more comfortable

Feedback collected from outpatient trials in Peterborough and The Lister oncology day units Sept/Oct 2020
